

Index view

For the index view, the feature that I included was the **snowflakes falling feature**. I included this feature because I wanted to give off a welcoming vibe for my website. I used the color light blue for the snowflakes falling because as a design choice, light colors complement other light colors well. It worked well because the shirt I am wearing in my profile picture is light blue and the background of my website is white.

Projects view

For my projects view, I led a team to create four Jupyter notebook assignments for a data science connector course known as CP101. This made me want to show each notebook as an image with a 2 by 2 layout so that the viewer of my website can see all the notebooks at once. I made sure there was white space between each one so that the viewer makes sure to focus on each one individually and not all together.

I also created a **css hovering effect for each picture with a description**. Each description has a different color to emphasize that each notebook is different from each other and have different learning goals. To allow the viewer to actually look at my notebooks, I posted links to datahub so that the viewer can actually do the assignment themselves!

Photos view

For my photos view, I had 9 images that sum up both my high school and college careers. I went for the **onclick enlargement with a description of each image** feature so that the viewer can understand what each event's significance is. I decided to go with the 3 by 3 layout so that the viewer can easily see all the images without having to scroll
